MWS Clock Plugin history:

Version 3.0.11

Action	Device	Issue
Fixed	Classic	The plugin did not start on devices that have no built-in phone; WM 6.X Classic devices and WM5.x that isn't "Phone Edition". The plugin now run correctly on these devices.
Fixed	Professional	Some pages of the Settings program were incorrectly formatted on some screen resolutions/orientations. This is now fixed.
Fixed	Standard	The font settings for Standard/Smartphone was not correct; On some screen resolutions, the used font could be different to the font used by other loaded plugins. This is now fixed. PLEASE NOTE: this might make the fonts look different than in the former release, but now the clock plugin will use the same font as the other plugins.
Adjusted	All	The overall performance of the plugin is 15-20% better than in previous release, though most of the improvements are in background processing and not that obvious.
Adjusted	All	Together with the 3.0.11 plugin release, the style packages are updated. This update is only targeting some installation problems where the style installation might fail if the packages were installed in the"wrong" order. The installation processes are now fixed to allow for any installation order. There are no changes to the contents of the style packages; if you already have a style package installed there is no need to install the new package.

Version 3.0.10

Action	Device	Issue
Fixed	All	The MeetRing sometimes displayed a complete ring even though such appointments were not present.
Fixed	All	The MeetRing rendering is now about 10 times faster than in previous release.
Fixed	All	Status info was not correctly re-positioned when the screen was rotated.
Fixed	All	When the device was put in Flight Mode, the Signal level sometimes was reported as "0". The Signal indicator is now disabled whenever the device is in Flight Mode.
Fixed	Professional	The Settings program didn't handle screen rotation correctly.
Adjusted	Professional	The Settings program is now slightly faster to start, and a "Wait cursor" is displayed whenever the program needs some time to prepare a page or load/save a style.
Fixed	Standard	The font settings for Standard/Smartphone was not correct; When the style was configured to use the "System Font" for date and/or status information, that was exactly what the plugin did - used the System Font. The problem is that on Standard/Smartphone devices, the System Font isn't used for Home Screen plugins. The plugin now parses the home.xml file for font settings and uses these settings when the "Use System Font" selection is used. PLEASE NOTE: this will undoubtedly make the fonts look different than

1

		in the former release, but now the clock plugin will use the same font as the other plugins.
Added	All	The Base Styles package now includes two additional styles (*MWS Brown 1* and *MWS Cyan 1*).
Adjusted	Professional	The Base Style package now includes Fixed themes only. (The change affects Professional/Pocket PC only; the Standard/Smartphone package had this configuration from the start.) The generic Base Themes can be downloaded from forum.mobilewithstyle.com if you want them as in the previous release.
Adjusted	All	The files "*default.mwsst.xml*" and "*default.mwsgl.xml*" are moved from the Base Styles package to the plugin package. This change is made to enable uninstallation of the Base Style package if you don't want it on the device. PLEASE NOTE: The "*default.mwsgl.xml*" file keeps the global settings that you configure with the Settings program. In the update from 3.0.9 to 3.0.10 you might lose the information in this file if you don't save it prior to the update. Please see the installation instructions for further details on how to proceed. (Future installation packages will ensure that these files are not lost or overwritten when a program update is performed)

Version 3.0.9

Action	Device	Issue
Launch	All	Initial public release
